Wind Forces

The axial, side and twisting moment forces stated are maximum loads applied to the tower by the antenna at a survival wind speed of 250 km/h (70 m/s). They are, in every case, the result of wind from the most critical direction for each parameter. The individual maximums may not occur simultaneously. All forces are referenced to the antenna mounting pipe.

Axial Force (F_A), N	934 (convex radome) / 1149 (flat radome)
Side Force (F_S), N	298 / 262
Twisting Moment (M_T), N•m	237 / 293
